ბაი & Family

Website management guide

Website	https://frossigneux.github.io/cafe/ (once a domain is connected: https://_____)
Editing	https://app.pagescms.org
Code and data	https://github.com/frossigneux/cafe
WhatsApp (orders)	+995 593 62 80 90
Version	2026-11-09

Parts 1–6 are for the café staff, parts 7–9 for a technician taking over the site. Georgian version: guide-ka.pdf.

1. How the site works

1. Visitors pick dishes on the site and tap “Send on WhatsApp”. The order arrives as a ready-made message on the café's WhatsApp number. There is no online payment on the site.
2. The menu, prices, photos and settings are stored on GitHub in `content/menu.json`, `content/settings.json` and `content/photos/`.
3. These files are edited with **Pages CMS** (app.pagescms.org): forms labelled in Georgian and English, no programming needed.
4. Every “Save” creates a commit on GitHub. GitHub checks the data and publishes the updated site within about 2 minutes.
5. If the data has a mistake, publishing stops and the previous version stays online, so customers never see a broken site.

Accounts

Service	What for	Owner
GitHub	Code, data, publishing	frossigneux
Pages CMS	Editing the menu and settings	Via GitHub or email invite
Worldbus.ge	Domain name (.ge)	_____
Google Business	Google Maps and Search listing	_____
Facebook	Café page	_____

2. Signing in and inviting staff

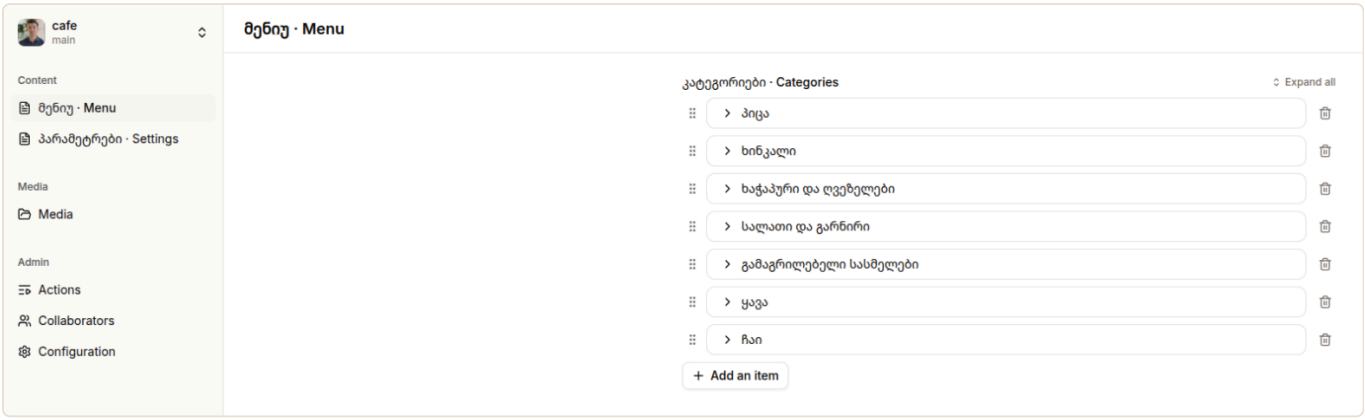

Owner (GitHub account)

open app.pagescms.org, click **Sign in with GitHub**. The first time, allow the Pages CMS app on the `frossigneux/cafe` repository (it can be limited to that one). Open the **cafe** project: the left bar shows Menu, Settings and Media.

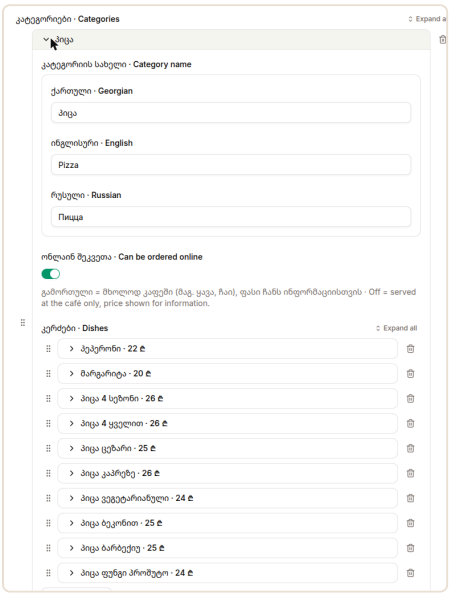

Staff (no GitHub account)

the owner goes to **Admin** → **Collaborators** → **Invite a collaborator** and enters their email. They receive a sign-in link by email; no password is needed. Afterwards they sign in at app.pagescms.org with the same email.

3. Editing the menu

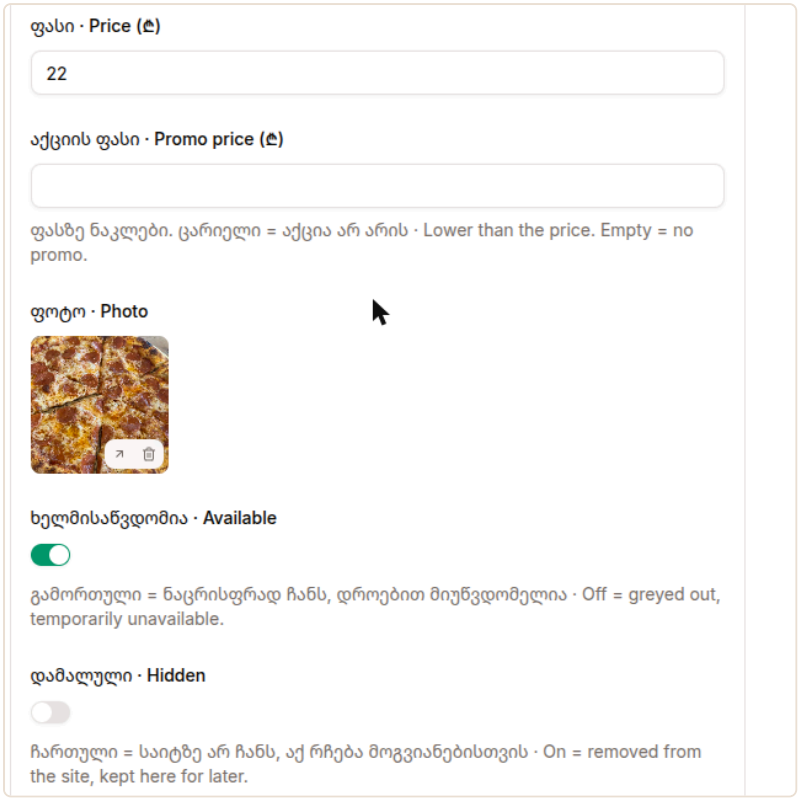

Menu: კატეგორიების სია · the list of categories

A category: name in three languages, “Can be ordered online”, its dishes

- **Open** a category (›), then a dish. **Expand all** opens everything.
- **Reorder** by dragging the ⠿ handle; the site follows the same order.
- **Add** with **Add an item** at the end of a list. **Delete** with the bin icon; prefer “Hidden” (below) so the dish can come back later.
- **Always finish with Save** (top right, green).
- **Can be ordered online** (category): off for coffee and tea, which are served at the café only. Their prices show for information, without the + button.

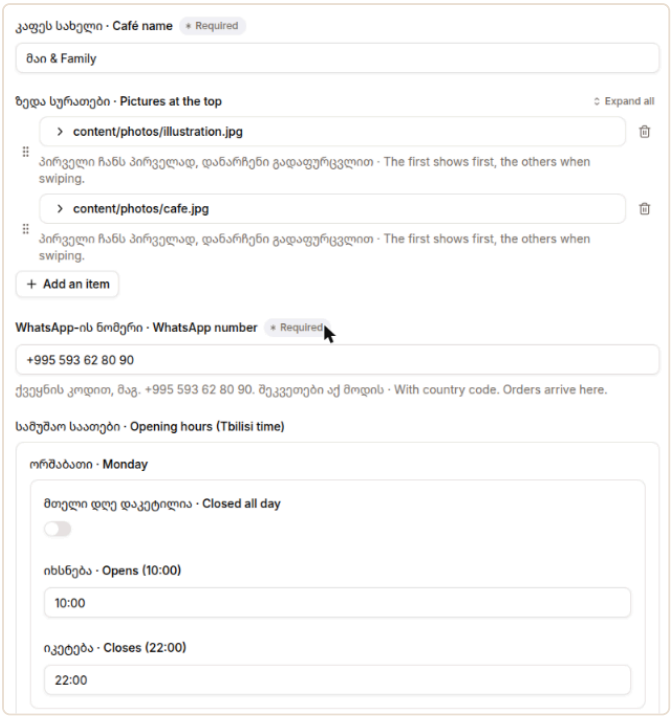

3. Dish fields (continued)

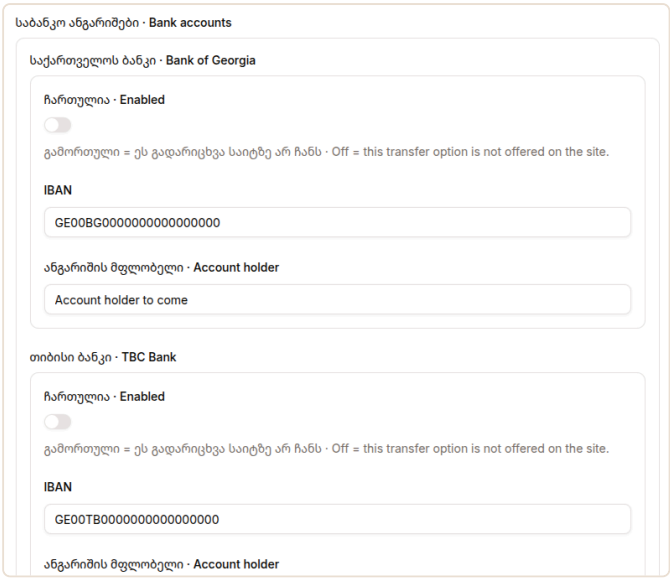

A dish: price, promo, photo, switches

- **Name / Description:** in Georgian, English and Russian. An empty language falls back to English.
- **Price:** a plain number without ₾, e.g. `22` or `3.5`.
- **Promo price:** lower than the price. The site strikes through the normal price and shows a “Promo” tag. Empty means no promo.
- **Photo:** upload from phone or computer. Landscape, about 600×480, works best.
- **Available:** off means temporarily unavailable (greyed out, cannot be ordered).
- **Hidden:** on removes the dish from the site but keeps it in the list for later.
- **Technical id:** leave it as it is.

4. Settings

Settings: name, top pictures, WhatsApp, hours

Each bank has its own switch

- **Café name:** site title and the social sharing image.
- **Pictures at the top:** the first shows first, the others on swipe. The first is also used when the link is shared on Facebook or WhatsApp. Give each a short description for blind visitors.
- **WhatsApp number:** where orders arrive, with country code.
- **Opening hours:** per day, Tbilisi time, 24-hour clock. Day off: switch on “Closed all day”. Closing after midnight is not supported.
- **Address, map pin** (two numbers from Google Maps), **Facebook link**.
- **Bank accounts:** paying at the café (card or cash) is always offered. The **Enabled** switch shows or hides the BOG or TBC transfer option; the site texts adapt by themselves. An enabled bank needs a valid Georgian IBAN and the account holder's name, which customers see and copy.

5. After saving

- The site updates within about **2 minutes**; check on a phone and reload if needed.
- History: the clock icon at the top right lists every change, who made it and when.
- **If nothing changed after 5 minutes**, the data probably has a mistake (e.g. promo price above the price, or a wrong IBAN). The previous version stays online. Open **Admin** → **Actions** in Pages CMS, or the **Actions** tab on GitHub: red ✗ → **build**; the end of the log says what to fix and where. Fix it and Save again.
- Avoid two people editing the same page at the same time.

6. Photos and good practice

- Photos: landscape, bright, dish in the centre. JPG, PNG or WebP; the site resizes them.
- One photo can serve several dishes (all khinkali share one).
- When a price changes, update the site, the printed menu and Google.
- Keep opening hours identical on the site, Google Business and Facebook.
- Orders arrive on WhatsApp: confirm each one to the customer there, as the order message asks.

7. For a technician

Static site built with **Astro 6** (Node 22), no server and no database. On every push to `main`, `.github/workflows/deploy.yml` builds it and publishes to **GitHub Pages**. Repository: `github.com/frossigneux/cafe`.

Path	Role
`content/menu.json`, `content/settings.json`	All café data. Validated at build time (`src/data/*.ts`); a mistake fails the build with a readable message.
`content/photos/`	Dish and gallery photos, referenced as `/photos/x.jpg`.
`.pages.yml`	Pages CMS form definition (bilingual labels).
`content/README.md`	How to edit the JSON directly on GitHub.
`src/i18n.ts`	Interface texts in ka / en / ru, and the WhatsApp message wording.
`src/components/OrderPage.astro`, `src/scripts/order.ts`, `src/styles/global.css`	Page, cart and WhatsApp logic, styles.
`scripts/make-og.py`	Builds `public/og.jpg` (social image) in CI from the name and first gallery picture.
`docs/guide/`	This guide (HTML, PDF, screenshots).
`DESIGN.md`, `PRODUCT.md`	Design system and product decisions.

Local work

```
git clone git@github.com:frossigneux/cafe.git && cd cafe
npm ci
npm run dev      # http://localhost:4321
npm run build    # same check as the publish workflow
```

Always `git pull` first: staff edits in Pages CMS are commits on `main`.

Pages CMS notes

- Pages CMS only keeps the fields declared in `.pages.yml`. Any new JSON key must be added there too, or it will be dropped on the next save.
- Empty fields are saved as `""` or `null`; the loaders treat them as absent.
- After changing `.pages.yml`, open the form and check the change. If Pages CMS still shows the old form, push another small change to `.pages.yml` (a comment): it refreshes its cached copy on GitHub's push notification.

8. Domain at Worldbus.ge

1. Register the domain at **worldbus.ge** (Domains), and note the account email: _____. Renew it every year, or the address stops working.
2. In the Worldbus DNS panel (default nameservers `ns1.worldbus.ge` / `ns2.worldbus.ge`), create:

   ```
   @    A      185.199.108.153
   @    A      185.199.109.153
   @    A      185.199.110.153
   @    A      185.199.111.153
   www  CNAME  frossigneux.github.io.
   ```

3. On GitHub: repository **Settings** → **Pages** → **Custom domain**, enter the domain, save, wait for the DNS check, then tick **Enforce HTTPS**. No `CNAME` file is needed with the Actions deployment.
4. Re-run the publish workflow (Actions → Publish site → Run workflow). The build reads the site address from GitHub Pages, so links, sitemap and sharing tags switch to the new domain and the `/cafe/` prefix disappears by itself.
5. Update the link on Google Business, Facebook and printed material.

Alternative hosting (private repository, Cloudflare Pages) is described in the repository `README.md`.

9. Google Business Profile

1. Open **business.google.com** with the café's own Google account (not a personal one). Account:

---

2. Name **ბაი & Family**; category Café (plus Pizza restaurant); address Natakhtari village, with the pin on the exact spot (site coordinates: 41.91935, 44.727734).
3. Phone +995 593 62 80 90, website link, opening hours identical to the site.
4. Verification: Google offers a video, call or postcard; follow its steps.
5. Add photos (front, interior, dishes) and extra managers (Settings → People and access), so access is never tied to a single person.
6. The site already publishes structured data (JSON-LD `CafeOrCoffeeShop`: name, address, coordinates, hours, Facebook) that helps Google match the listing.
